

Changes made to Class library:

Made a class to contain the variables for a module.

The class only consists of properties that represent each column in the Module table in the database.

Changed the User class into a Login and Register class.

Created a Model folder to store the Module class instead of creating it in the main project.

Created a ViewModel class to store the Login and Register class.

Also added data annotations to show which property is required or not. What datatype is the property. As well the **key** annotation to present a property as a primary and auto increments when migrated.

Removed the methods to perform calculations for self-study hours required and added it the code behind in the Module page and is calculated when user enters a module.
